

# Polymorphism

## Lecture 6

Dr. Tamer ABUHMED  
Java Programming Course (SWE2023)  
College of Computing

# Outline

- What is **Polymorphism** ?
- Superclass reference at a subclass object
- Downcasting
- Polymorphism using **Abstract Classes**
  - Full Example
- Polymorphism using **Interface**
  - Full Example

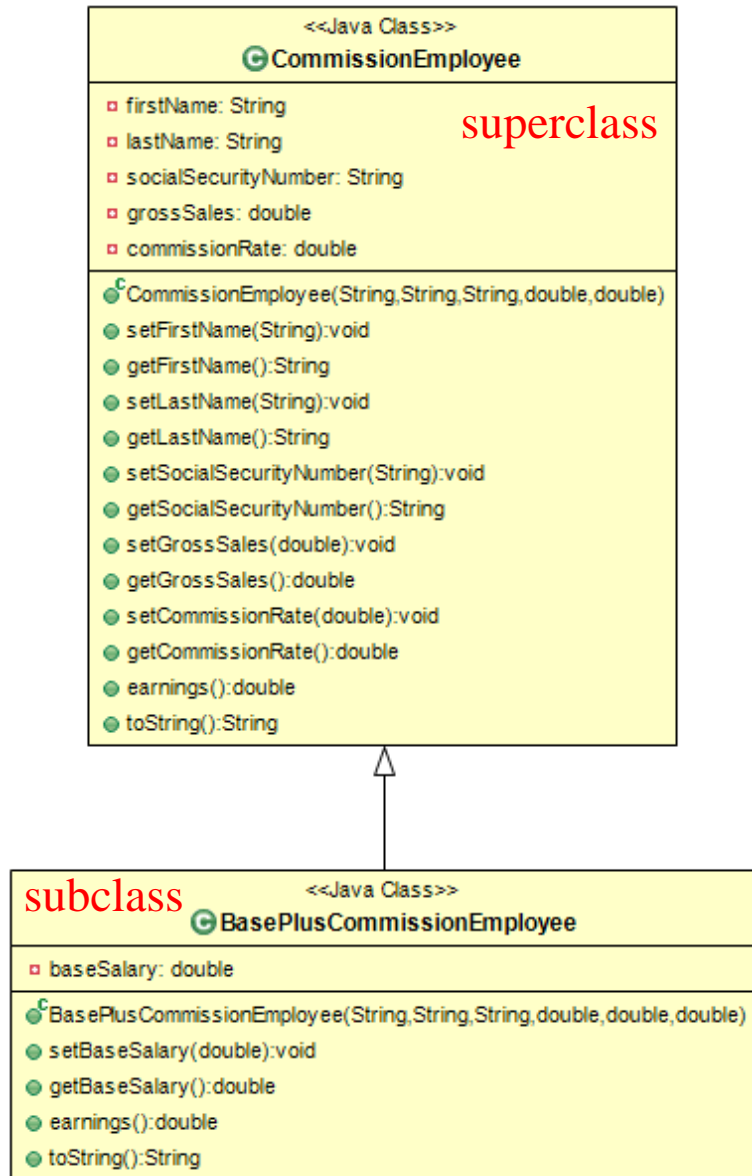

# Introduction

- Polymorphism
  - Enables you to “program in the general” rather than “program in the specific.”
  - Polymorphism enables you to write programs that process objects that share the same superclass as if they’re all objects of the superclass; this can simplify programming.

# Superclass reference at a subclass object

```
public class PolymorphismTest
{
    public static void main( String[] args )
    {
        // assign superclass reference to superclass variable
        CommissionEmployee commissionEmployee = new CommissionEmployee(
            "Sue", "Jones", "222-22-2222", 10000, .06 );

        // assign subclass reference to subclass variable
        BasePlusCommissionEmployee basePlusCommissionEmployee =
            new BasePlusCommissionEmployee(
                "Bob", "Lewis", "333-33-3333", 5000, .04, 300 );

        // invoke toString on superclass object using superclass variable
        System.out.printf( "%s %s:\n\n%s\n\n",
            "Call CommissionEmployee's toString with superclass reference ",
            "to superclass object", commissionEmployee.toString() );

        // invoke toString on subclass object using subclass variable
        System.out.printf( "%s %s:\n\n%s\n\n",
            "Call BasePlusCommissionEmployee's toString with subclass",
            "reference to subclass object",
            basePlusCommissionEmployee.toString() );

        // invoke toString on subclass object using superclass variable
        CommissionEmployee commissionEmployee2 =
            basePlusCommissionEmployee;
        System.out.printf( "%s %s:\n\n%s\n\n",
            "Call BasePlusCommissionEmployee's toString with superclass",
            "reference to subclass object", commissionEmployee2.toString()
        );
    } // end main
} // end class PolymorphismTest
```

superclass variable assigned  
to subclass variable

Call method in subclass class

# Superclass reference at a subclass object

- In the previous example, we invoking a method on a subclass object via a superclass reference.
- A superclass object cannot be treated as a subclass object, because a superclass object is *not* an object of any of its subclasses.
- Cannot do assignment of subclass reference to super class object  
`basePlusCommissionEmployee = commissionEmployee2;` 
- The Java compiler *does* allow the assignment of a superclass reference to a subclass variable if you explicitly cast the superclass reference to the subclass type
  - A technique known as **downcasting** that enables a program to invoke subclass methods that are not in the superclass.

# Downcasting

```
public class Parent{}  
public class Child extends Parent{  
    public static void main(String args[]) {  
        Parent parent = new Child();  
        // a variable holding a value of type Child  
        Child child = (Child)parent;  
        // OK since parent variable is currently  
        // holding Child instance  
    }  
}
```

downcasting is the act of casting a reference of a super class to one of its subclasses

```
public class Parent{}  
public class Child extends Parent{  
    public static void main(String args[]) {  
        Parent parent = new parent();  
        // a variable holding a value of type parent  
        Child child = (Child) parent;   
        // Not OK since parent variable is currently  
        // holding parent instance  
    }  
}
```

## Output

```
Exception in thread "main"  
java.lang.ClassCastException: Parent cannot  
be cast to Child  
at Child.main(Parent.java:8)
```

# Abstract Classes and Methods

- Abstract classes

- Used only as superclasses in inheritance hierarchies, so they are sometimes called **abstract superclasses**.
- **Cannot be used to instantiate objects**—abstract classes are incomplete.
- **Subclasses** must **declare** the “missing pieces” to become “concrete” classes, from which you can instantiate objects;
- Thus, Classes that can be used to instantiate objects are called **concrete classes**.

```
CommissionEmployee e = new CommissionEmployee ()
```

- An abstract class provides a superclass from which other classes can inherit and thus share a common design.

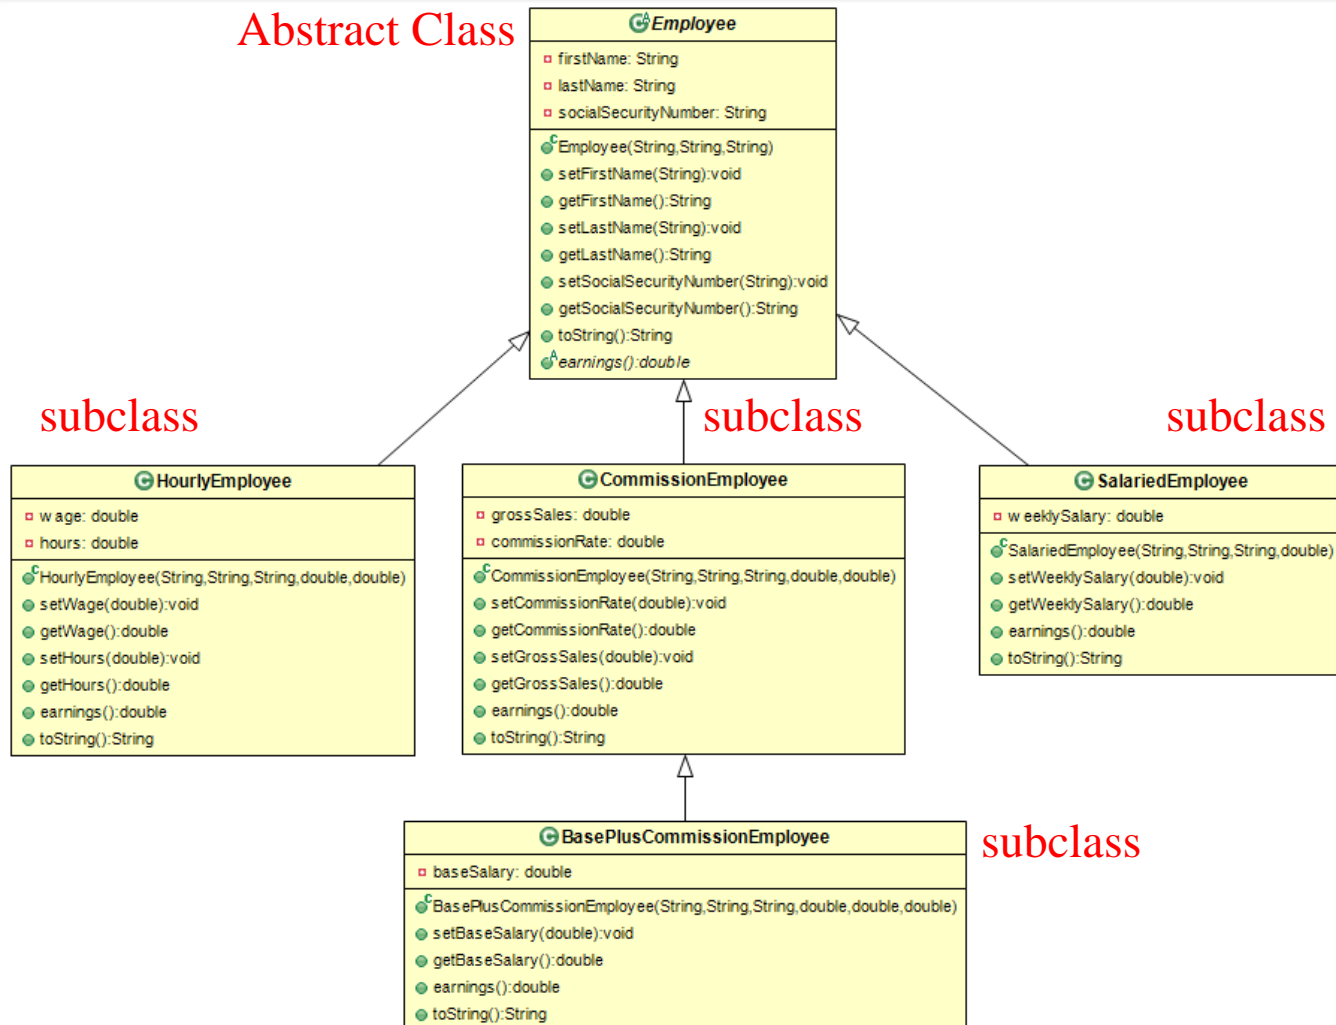

# Abstract Classes and Methods

- **Abstract superclasses** are too **general** to create real objects—they specify only what is **common among subclasses**.
- You make a class abstract by declaring it with keyword **abstract**.  
`public abstract class Employee{} // abstract class`
- An abstract class normally contains one or more **abstract methods**.
  - An abstract method is one with keyword **abstract** in its declaration, as in  
`public abstract void draw(); // abstract method`
- **Abstract methods do not provide implementations**
- A **class** that **contains abstract methods** must be an **abstract class** even if that class contains some concrete (**nonabstract**) methods.
- Constructors and **static** methods **cannot** be abstract methods.

# Abstract Class - Full Example

# Abstract Class - Full Example (1/5)

```
public abstract class Employee
{
    private String firstName;
    private String lastName;
    private String socialSecurityNumber;

    // three-argument constructor
    public Employee( String first, String
last, String ssn )
    {
        firstName = first;
        lastName = last;
        socialSecurityNumber = ssn;
    } // end three-argument Employee
constructor

    // set first name
    public void setFirstName( String first )
    {
        firstName = first; // should validate
    } // end method setFirstName

    // return first name
    public String getFirstName()
    {
        return firstName;
    } // end method getFirstName
}
```

```
// set last name
public void setLastName( String last )
{
    lastName = last; // should validate
} // end method setLastName

// return last name
public String getLastName()
{
    return lastName;
} // end method getLastName

// set social security number
public void setSocialSecurityNumber( String ssn )
{
    socialSecurityNumber = ssn; // should validate
} // end method setSocialSecurityNumber

// return social security number
public String getSocialSecurityNumber()
{
    return socialSecurityNumber;
} // end method getSocialSecurityNumber

// return String representation of Employee object
@Override
public String toString()
{
    return String.format( "%s %s\nsocial security
number: %s",
        getFirstName(), getLastName(),
        getSocialSecurityNumber() );
} // end method toString

// abstract method overridden by concrete subclasses
public abstract double earnings(); // no
implementation here
} // end abstract class Employee
```

# Abstract Class - Full Example (2/5)

## Inheritance

```
public class CommissionEmployee extends Employee
{
    private double grossSales; // gross weekly sales
    private double commissionRate; // commission percentage

    // five-argument constructor
    public CommissionEmployee( String first, String
last, String ssn,
        double sales, double rate )
    {
        super( first, last, ssn );
        setGrossSales( sales );
        setCommissionRate( rate );
    } // end five-argument constructor

    // set commission rate
    public void setCommissionRate( double rate )
    {
        if ( rate > 0.0 && rate < 1.0 )
            commissionRate = rate;
        else
            throw new IllegalArgumentException(
                "Commission rate must be > 0.0 and < 1.0"
            );
    } // end method setCommissionRate
    // return commission rate
    public double getCommissionRate()
    {
        return commissionRate;
    } // end method getCommissionRate
}
```

```
// set gross sales amount
public void setGrossSales( double sales )
{
    if ( sales >= 0.0 )
        grossSales = sales;
    else
        throw new IllegalArgumentException(
            "Gross sales must be >= 0.0" );
} // end method setGrossSales

// return gross sales amount
public double getGrossSales()
{
    return grossSales;
} // end method getGrossSales

// calculate earnings; override abstract method
earnings in Employee
@Override
public double earnings()
{
    return getCommissionRate() * getGrossSales();
} // end method earnings

// return String of CommissionEmployee object
@Override
public String toString()
{
    return String.format( "%s: %s\n%s: $%,.2f; %s:
%.2f",
        "commission employee", super.toString(),
        "gross sales", getGrossSales(),
        "commission rate", getCommissionRate() );
} // end method toString
} // end class CommissionEmployee
```

override abstract method

override toString method

# Abstract Class - Full Example (3/5)

```
public class BasePlusCommissionEmployee extends
CommissionEmployee
{
    private double baseSalary; // base salary per week

    // six-argument constructor
    public BasePlusCommissionEmployee( String first,
String last,
String ssn, double sales, double rate, double
salary )
    {
        super( first, last, ssn, sales, rate );
        setBaseSalary( salary ); // validate and store
base salary
    } // end six-argument BasePlusCommissionEmployee
constructor

    // set base salary
    public void setBaseSalary( double salary )
    {
        if ( salary >= 0.0 )
            baseSalary = salary;
        else
            throw new IllegalArgumentException(
                "Base salary must be >= 0.0" );
    } // end method setBaseSalary
```

Inheritance

```
// return base salary
public double getBaseSalary()
{
    return baseSalary;
} // end method getBaseSalary

// calculate earnings; override method earnings in
CommissionEmployee
@Override

        return 40 * getWage() + ( getHours() - 40 ) * getWage() *
1.5;
} // end method earnings

// return String representation of HourlyEmployee object
@Override
public String toString()
{
    return String.format( "hourly employee: %s\n%s: $%,.2f; %s:
%,.2f",
        super.toString(), "hourly wage", getWage(),
        "hours worked", getHours() );
} // end method toString
} // end class HourlyEmployee
```

override abstract method

override toString method

# Abstract Class - Full Example (5/5)

```
public class SalariedEmployee extends Employee
{
    private double weeklySalary;

    // four-argument constructor
    public SalariedEmployee( String first,
String last, String ssn,
        double salary )
    {
        super( first, last, ssn ); // call Employee
        constructor
        setWeeklySalary( salary );
    } // end four-argument constructor

    // set salary
    public void setWeeklySalary( double salary )
    {
        if ( salary >= 0.0 )
            weeklySalary = salary;
        else
            throw new IllegalArgumentException(
                "Weekly salary must be >= 0.0" );
    } // end method setWeeklySalary
```

Inheritance

```
// return salary
public double getWeeklySalary()
{
    return weeklySalary;
} // end method getWeeklySalary

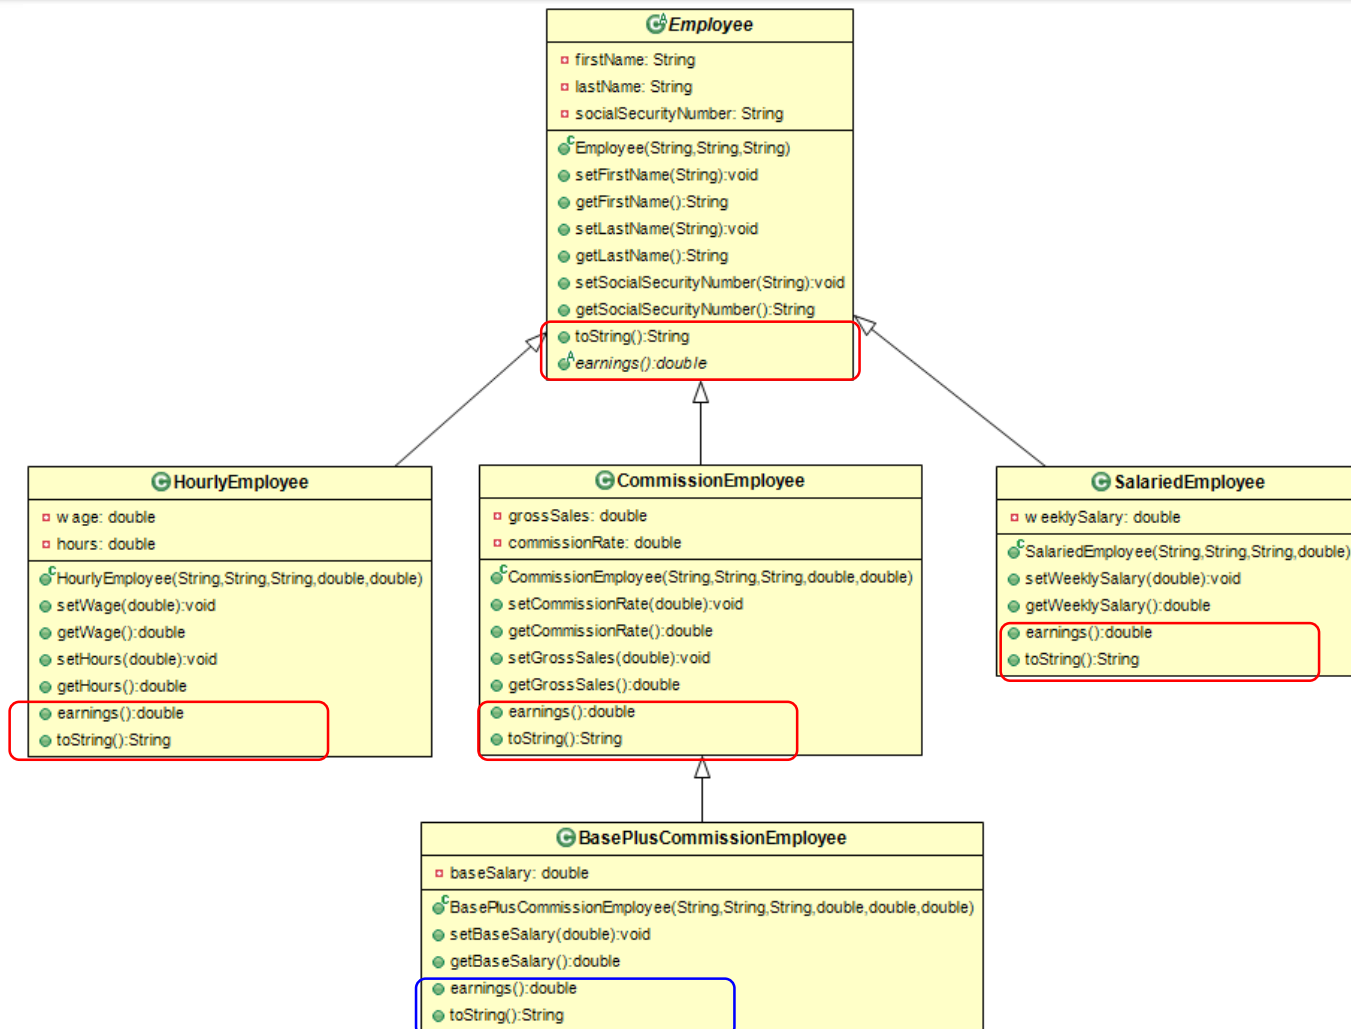

// calculate earnings; override abstract
method earnings in Employee
@Override
public double earnings()
{
    return getWeeklySalary();
} // end method earnings

// return String of SalariedEmployee object
@Override
public String toString()
{
    return String.format( "salaried
employee: %s\n%s: $%,.2f",
        super.toString(), "weekly salary",
        getWeeklySalary() );
} // end method toString
} // end class SalariedEmployee
```

override abstract method

override toString method

# Abstract Class - Full Example

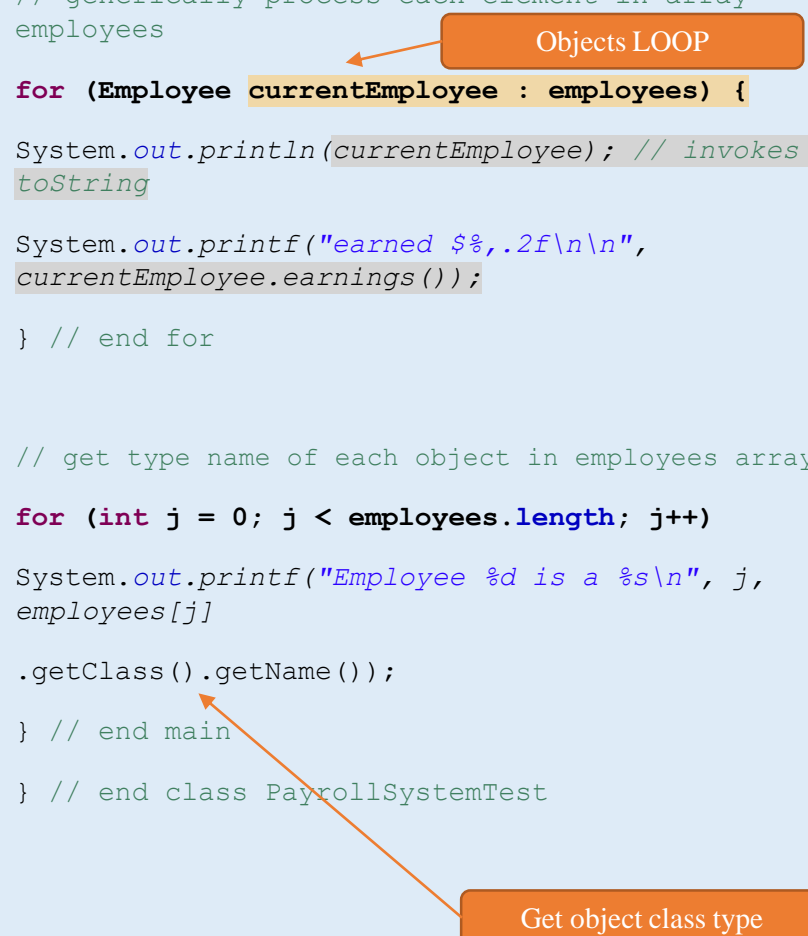

# Abstract Class - Full Example Test

```
public class PayrollSystemTest {  
  
    public static void main(String[] args) {  
  
        // create four-element Employee array  
  
        Employee[] employees = new Employee[4];  
  
  
        // initialize array with Employees  
  
        employees[0] =  
        new SalariedEmployee("John", "Smith", "111-11-1111", 800.00);  
  
        employees[1] =  
        new HourlyEmployee("Karen", "Price", "222-22-2222", 16.75,  
        40);  
  
        employees[2] =  
        new CommissionEmployee("Sue", "Jones", "333-33-3333", 10000,  
        .06);  
  
        employees[3] =  
        new BasePlusCommissionEmployee("Bob", "Lewis", "444-44-4444",  
        5000, .04, 300);  
  
        System.out.println("Employees processed polymorphically:\n");  
    }  
}
```

Each employee reference has different initialization

```
// generically process each element in array  
employees  
  
for (Employee currentEmployee : employees) {  
  
    System.out.println(currentEmployee); // invokes  
    toString  
  
    System.out.printf("earned $%,.2f\n\n",  
    currentEmployee.earnings());  
  
} // end for  
  
  
// get type name of each object in employees array  
  
for (int j = 0; j < employees.length; j++)  
  
    System.out.printf("Employee %d is a %s\n", j,  
    employees[j]  
    .getClass().getName());  
  
} // end main  
  
} // end class PayrollSystemTest
```

Objects LOOP

Get object class type

# Abstract Class - Full Example Test

## Output

Employees processed polymorphically:

salaried employee: John Smith  
social security number: 111-11-1111  
weekly salary: \$800.00  
earned \$800.00

hourly employee: Karen Price  
social security number: 222-22-2222  
hourly wage: \$16.75; hours worked: 40.00  
earned \$670.00

commission employee: Sue Jones  
social security number: 333-33-3333  
gross sales: \$10,000.00; commission rate: 0.06  
earned \$600.00

base-salaried commission employee: Bob Lewis  
social security number: 444-44-4444  
gross sales: \$5,000.00; commission rate: 0.04; base salary: \$300.00  
earned \$500.00

Employee 0 is a SalariedEmployee  
Employee 1 is a HourlyEmployee  
Employee 2 is a CommissionEmployee  
Employee 3 is a BasePlusCommissionEmployee

# Interface

- **Interfaces** offer a capability requiring that unrelated classes implement a set of common methods.
- Interfaces define and standardize the ways in which things such as people and systems can interact with one another.
- The interface specifies *what* methods are permitted to use but does not specify *how* the methods are performed.
  - A Java interface describes a set of methods that can be called on an object.

# Interface

- An **interface declaration** begins with the keyword **interface** and contains only constants and **abstract** methods.
  - All interface members must be **public**.
  - Interfaces may not specify any implementation details, such as concrete method declarations and instance variables.
  - All methods declared in an interface are implicitly **public abstract** methods.
  - All fields are implicitly **public, static** and **final**.

```
public interface Payable  
{  
    double getPaymentAmount();  
}
```

Interface Payable

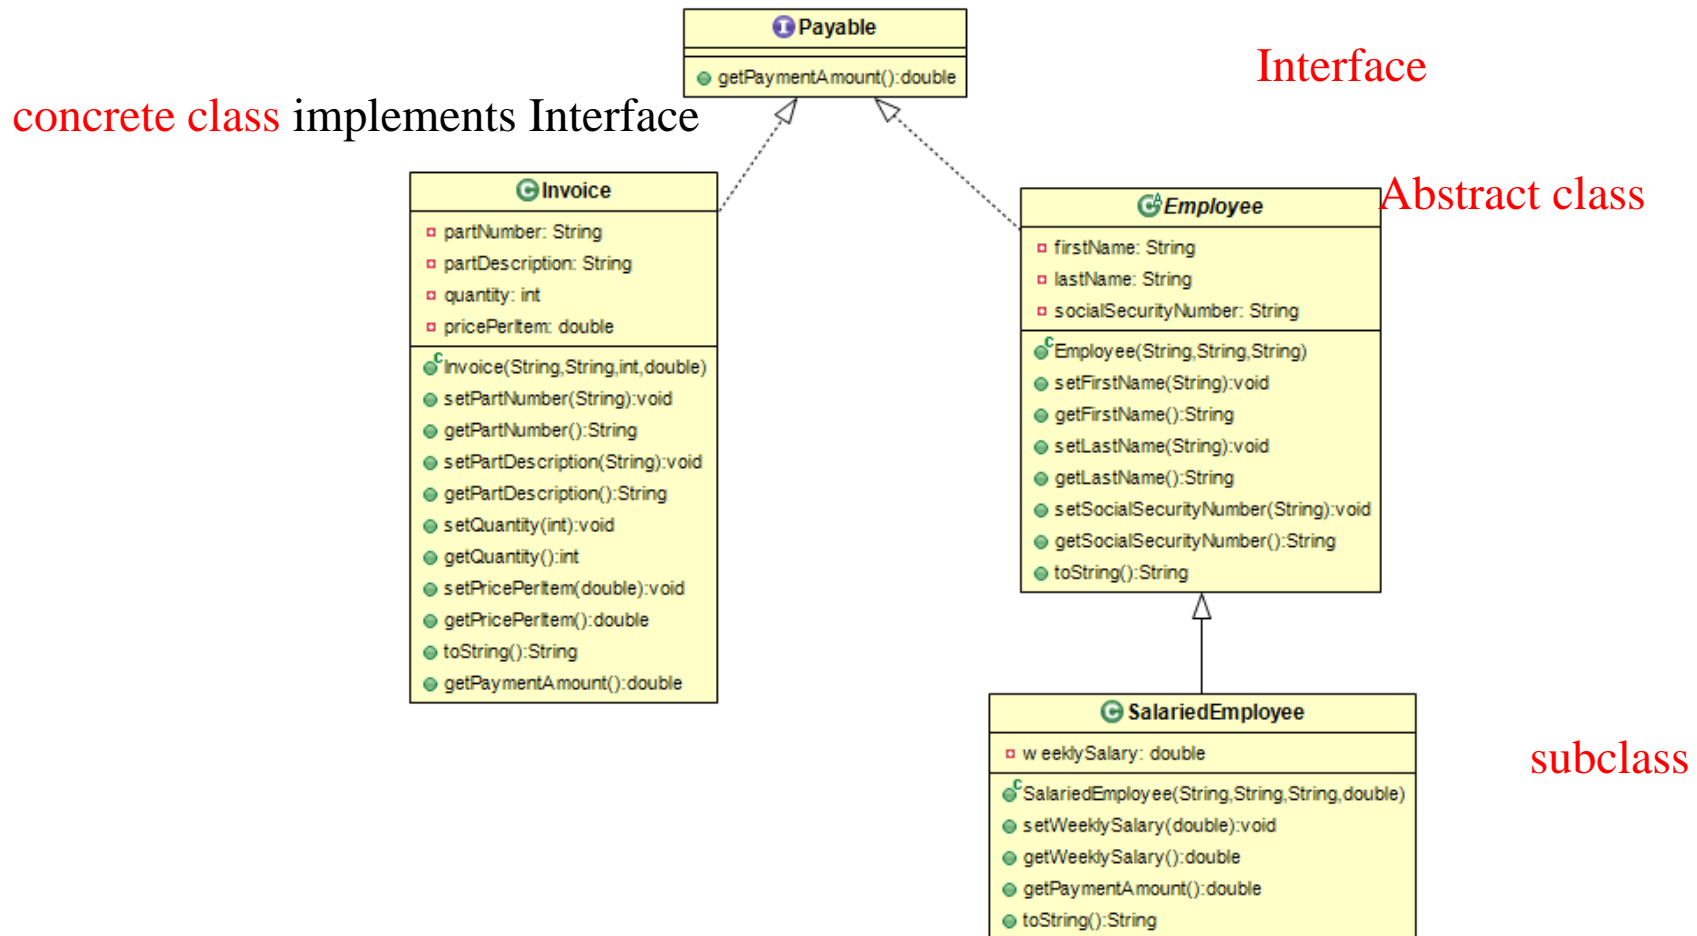

Abstract method

# Interface

- An interface cannot extend a class
- A class cannot extend an interface
- To use an interface, a concrete class must specify that it **implements** the interface and must declare each method in the interface with specified signature.
  - Add the **implements** keyword and the name of the interface to the end of your class declaration's first line.
- A class that does not implement all the methods of the interface is an abstract class and must be declared **abstract**.
- Java does not allow subclasses to inherit from more than one superclass, but it allows a class to inherit from one superclass and implement as many interfaces as it needs.

# Interface - Full Example

# Interface- Full Example (1/3)

```
public class Invoice implements Payable
{
    private String partNumber;
    private String partDescription;
    private int quantity;
    private double pricePerItem;
    // four-argument constructor
    public Invoice( String part, String description, int count,
        double price )
    {
        partNumber = part;
        partDescription = description;
        setQuantity( count ); // validate and store quantity
        setPricePerItem( price ); } // end constructor

    public void setPartNumber( String part )
    {
        partNumber = part; // should validate
    } // end method setPartNumber

    public String getPartNumber()
    {
        return partNumber;
    } // end method getPartNumber

    public void setPartDescription( String description )
    {
        partDescription = description; // should validate
    } // end method setPartDescription
    public String getPartDescription()
    {
        return partDescription;
    } // end method getPartDescription
```

implements Interface  
Payable

```
    public void setQuantity( int count )
    {
        quantity = count;
    } // end method setQuantity

    public int getQuantity()
    {
        return quantity;
    } // end method getQuantity

    public void setPricePerItem( double price )
    {
        if ( price >= 0.0 )
            pricePerItem = price;
        else
            throw new IllegalArgumentException(
                "Price per item must be >= 0" );
    } // end method setPricePerItem

    public double getPricePerItem()
    {
        return pricePerItem;
    } // end method getPricePerItem

    @Override
    public String toString()
    {
        return String.format( "%s: \n%s: %s (%s) \n%s: %d \n%s: %f",
            "invoice", "part number", getPartNumber(),
            "quantity", getQuantity(), "price per item",
            getPricePerItem() );
    } // end method toString

    @Override
    public double getPaymentAmount()
    {
        return getQuantity() * getPricePerItem(); // calculate
        total cost
    } // end method getPaymentAmount
} // end class Invoice
```

override method

override abstract method

# Interface- Full Example (2/3)

```
public abstract class Employee implements Payable
{
    private String firstName;
    private String lastName;
    private String socialSecurityNumber;

    // three-argument constructor
    public Employee( String first, String last, String
ssn )
    {
        firstName = first;
        lastName = last;
        socialSecurityNumber = ssn;
    } // end three-argument Employee constructor

    // set first name
    public void setFirstName( String first )
    {
        firstName = first; // should validate
    } // end method setFirstName

    // return first name
    public String getFirstName()
    {
        return firstName;
    } // end method getFirstName
}
```

We do not implement Payable method  
getPaymentAmount here so this class must be  
declared abstract

```
public void setLastName( String last )
{
    lastName = last; // should validate
} // end method setLastName

public String getLastName()
{
    return lastName;
} // end method getLastName

public void setSocialSecurityNumber( String ssn )
{
    socialSecurityNumber = ssn; // should validate
} // end method setSocialSecurityNumber

// return social security number
public String getSocialSecurityNumber()
{
    return socialSecurityNumber;
} // end method getSocialSecurityNumber

// return String representation of Employee object
@Override
public String toString() ← override method
{
    return String.format( "%s %s\nsocial security number:
%s",
        getFirstName(), getLastName(),
        getSocialSecurityNumber() );
} // end method toString
} // end abstract class Employee
```

# Interface- Full Example (3/3)

```
public class SalariedEmployee extends Employee
{
    private double weeklySalary;

    // four-argument constructor
    public SalariedEmployee( String first, String last, String ssn,
        double salary )
    {
        super( first, last, ssn ); // pass to Employee constructor
        setWeeklySalary( salary ); // validate and store salary
    } // end four-argument SalariedEmployee constructor

    // set salary
    public void setWeeklySalary( double salary )
    {
        if ( salary >= 0.0 )
            weeklySalary = salary;
        else
            throw new IllegalArgumentException(
                "Weekly salary must be >= 0.0" );
    } // end method setWeeklySalary

    // return salary
    public double getWeeklySalary()
    {
        return weeklySalary;
    } // end method getWeeklySalary

    // calculate earnings; implement interface Payable method that was
    // abstract in superclass Employee
    @Override
    public double getPaymentAmount()
    {
        return getWeeklySalary();
    } // end method getPaymentAmount

    // return String representation of SalariedEmployee object
    @Override
    public String toString()
    {
        return String.format( "salaried employee: %s\n%s: $%,.2f",
            super.toString(), "weekly salary", getWeeklySalary() );
    } // end method toString
} // end class SalariedEmployee
```

Inheritance

override abstract method

override method

```
public class PayableInterfaceTest
{

# Interface- Full Example Test

## Output

Invoices and Employees processed polymorphically:

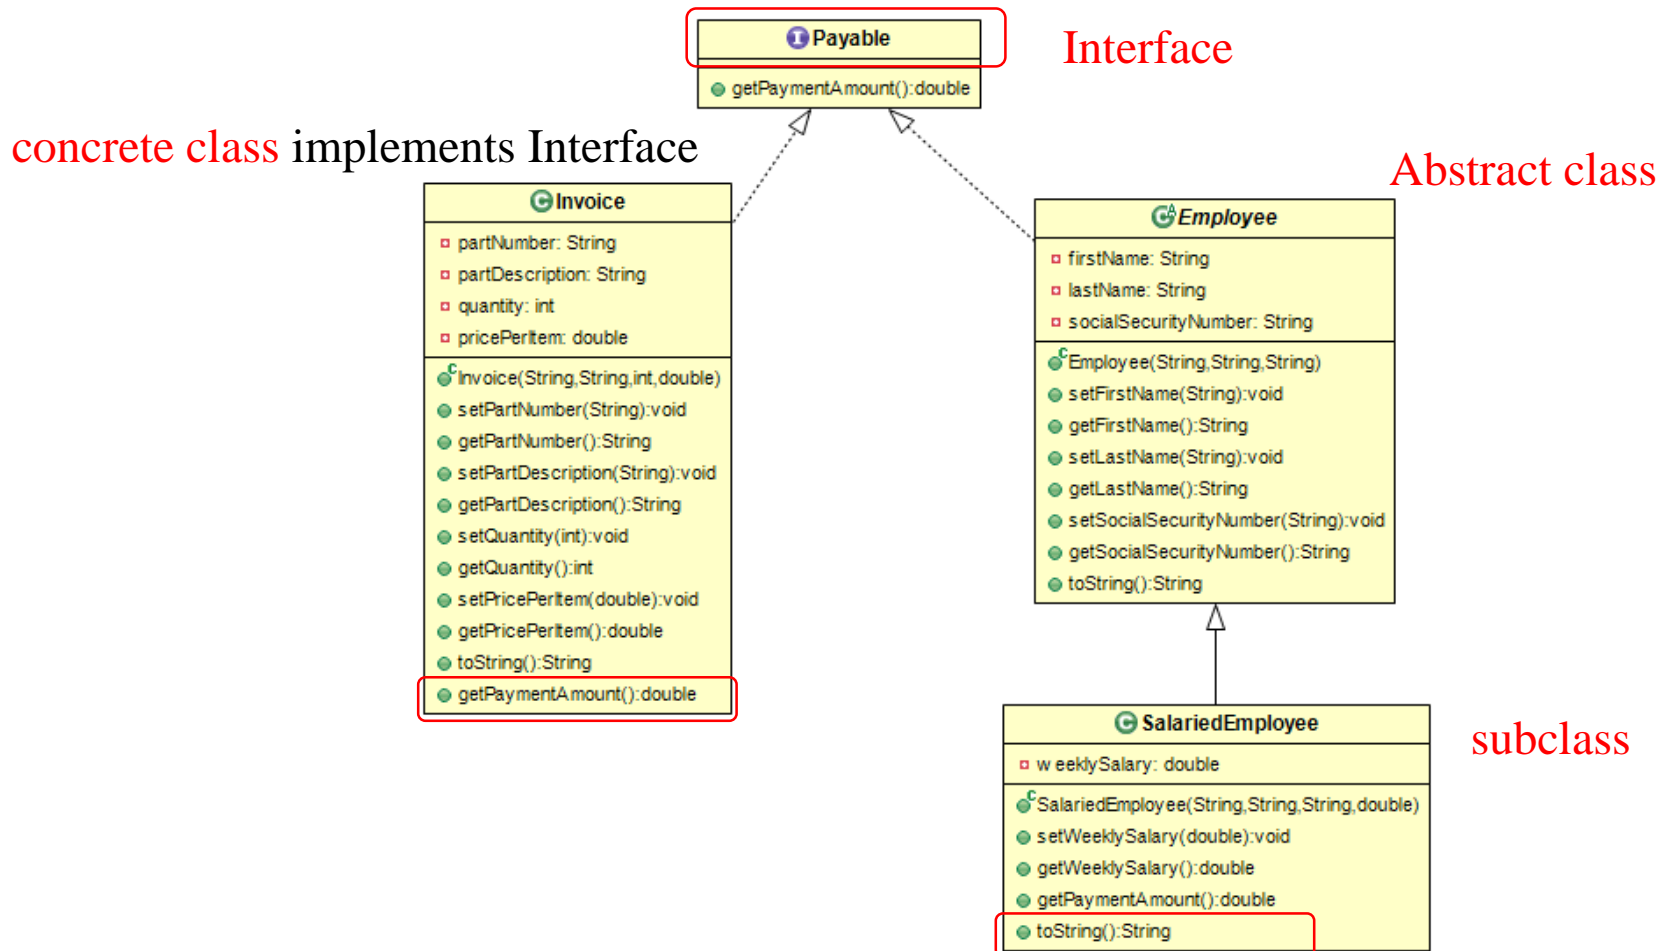

```
invoice:
part number: 01234 (seat)
quantity: 2
price per item: $375.00
payment due: $750.00
```

```
invoice:
part number: 56789 (tire)
quantity: 4
price per item: $79.95
payment due: $319.80
```

```
salaried employee: John Smith
social security number: 111-11-1111
weekly salary: $800.00
payment due: $800.00
```

```
salaried employee: Lisa Barnes
social security number: 888-88-8888
weekly salary: $1,200.00
payment due: $1,200.00
```

# Interface - Full Example

# Summary

- What is Polymorphism ?
- Superclass reference at a subclass object
- Downcasting
- Polymorphism using Abstract Classes
  - Full Example
- Polymorphism using Interface
  - Full Example
